Study Date:	

MRI ABDOMEN WITH MRCP

PROTOCOL : Axial T1 & T2; Coronal T1 & T2; 3DMRCP

OBSERVATION:

Liver:

Liver is enlarged in size -19.1 cm in size, morphology and has normal signal intensity in the various sequences. Margins are smooth. No focal lesions seen. Mild prominence of left lobe IHBR seen

Gall bladder:Gall bladder appears adequately distended. Multiple filling defects in the gall bladder lumen seen , largest measuring 27 mm at the GB neck . wall of GB is normal -2mm

CBD measures 15 mm at porta and there is a calculus of 5.5 mm , just adjacent to the ampulla

Pancreas:

Pancreas is normal in size, contour and signals. Pancreatic duct is not dilated. No definite evidence of pancreatitis, peripancreatic fluid or pseudocysts.

Stomach:

Stomach is well distended with fluid and has normal thin walls with smooth margins.

Spleen:

Spleen shows enlarged -13 .5 cm size, shape and signal intensities.

Kidneys:

Both kidneys are normal in size, morphology and signals. They show normal smooth contour. No hydronephrosis. Cortico-medullary differentiation appears normal. Perinephric fat is normal. Both adrenals are normal. Multiple simple cysts of 1-2 cm in both the kidneys

The visualised abdominal wall is normal in contour and its muscles appear normal.

Patient ID: PA05	Patient Name: Anonymous
Age: 42 Years	Sex: F
Accession Number:	Modality: MR
Referring Physician:	Study: MRCP
Study Date:	

Pancreatic duct appears normal.

Periampullary region appears normal.

OLD REPORTS PROVIDED : YES / NO

IMPRESSION: MRCP findings are s/o Hepatosplenomegaly with bilateral simple renal cysts
Cholelithiasis with dilated extrahepatic CBD secondary to distal CBD calculus

•

ADVICE : ERCP and clinical correlation
